

ACRYLIC EXTERIOR PLASTERS AND FACADE SILICONE PAINTS

The Paints and Lacquers Manufacture Company **Malfarb Sp. z o. o.** is one of the largest manufacturer of ecological products in Poland. Malfarb was founded in 1982. The company specializes in emulsion paint,

prime and disinfecting preparations, glues and skim coats. The company products reach high ecological expectations which are approved with attests of National Hygiene Institute and are selling very well on the Polish and eastern market.

The British coatings industry has adopted a VOC labelling scheme for all decorative coatings to inform customers about the levels of organic solvents and other volatile materials present. Malfarb products feature low VOC content

The technology of insulated external render is one of many ecological solutions that are used to improve living conditions. Maybe up front green building may cost more, however you save through lower operating costs over the life of building. The green building approach involves many project life cycle cost analysis, which determine the appropriate up-front expenditure and cost over the useful life of the asset. For instance the house energy audit calculator enable you to determine, where energy is being lost due to heat escaping from your house. Most buildings can reach the energy efficiency levels by incorporating new render eco technologies. The out-of-date design strategies affect building energy performance.

Decorative renders systems are becoming even more popular in today's green construction industry. Malfarb is a manufacturer of decorative finish renders for external wall insulations. Insulation systems produced by Malfarb are based on the high quality adhesive mortar Termit MZ-51 or Termit MZ-52, both designed for fixing mineral wool and foamed polystyrene in jointless heat insulation systems. Malfarb Decorative Render System have features of quality, efficiency, productivity and good value for money. Acrylic Exterior Plasters and Facade Silicon Paints provide the wide choice

of shades and textures to express the design concepts. This decorative system will cope with every wall structure and background conditions. Easy application process will meets every plasterer demands.

ACRYLIC EXTERIOR PLASTERS

Acrylic plasters are available in all colours, in three different structure and different grain sizes:

- **MT-41** with 'bark beetle trace' texture
- **MT-42** with 'sheepskin' structure
- **MT-43** free style texture

They are used to make decorative and protective thin-layer plasters indoors and outdoors. Highly covering, allows the surface to breathe and dry out. Acrylic plasters have numerous advantages, such as good workability, high elasticity and durability, optimal adhesion, higher crack resistance, are highly waterproof, and what is very

significant, are resistant to aggressive environmental effect. They protects walls from pollution and different weather conditions.

FACADE SILICONE PAINTS

Facade Silicone Paints are probably the world's most modern facade coatings. Malfarb manufacture water-based MF-11 matt silicate paint for use on exterior mineral walls and high quality water soluble **MF-21** silicone paint or MF-31 satin silicon paint, designed for decorative and protective coating of building facades. Both **MF-21** and **MF-31** perfectly cover various substrates: form cement/lime plasterwork, concrete slabs, aerated concrete, bricks, stones, mineral and acrylic plasterwork and putties. Facade Silicone Paints create firmly bonded coating and feature high coverage capacity, weather-resistance, easy application, good resistance to soiling, permeability to vapor, protects against the growth of microorganisms such as fungi or algae, damp resistance. Those are some of the realization where the Malfarb
